

United Technologies Corporation
Alliance to Save Energy
“Galaxy” Star of Energy Efficiency – Award Submittal

United Technologies Corporation (UTC) has been measuring and reporting its environmental impact for more than 15 years. Since it first began setting environmental goals in 1991, the company has been committed to reducing energy use, water consumption and waste throughout its operations. In 2007, UTC launched its latest set of environmental goals after exceeding its previous goals for the 10-year period ending in 2006.

These latest EH&S goals will extend through 2010 and include absolute metrics rather than normalizing for volume. Progress includes a 5 percent reduction in absolute greenhouse gas (GHG) emissions and a 6 percent reduction in absolute water use from 2006. UTC is well on its way to achieve its goal of 12 percent GHG reduction and 10 percent water reduction by 2010.

Another target in these goals is to invest \$100 million from 2007 to 2010 in energy conservation projects, including co-generation systems. Last year, UTC identified more than 600 projects valued at \$80 million and funded \$31 million, half of which supports co-generation systems. The co-generation system at Pratt & Whitney’s Middletown, Connecticut, facility is operational. UTC’s Newington, Connecticut, data center is installing a UTC Power PureComfort system which will be running later this year. Co-generation systems at Sikorsky in Stratford, Connecticut, and Hamilton Sundstrand in Windsor Locks, Connecticut, will be on line in 2009 and 2010, respectively.

UTC believes climate change is a critical environmental concern. With a worldwide real estate portfolio of more than 100 million square feet, it is committed to designing and building new facilities with the lowest possible environmental footprint. In 2008, UTC began using the U.S. Green Building Council’s Leadership in Energy and Environmental Design (LEED) rating system in all new facilities, whether owned or leased. Two of these new facilities are in China. In 2007, the Otis Elevator Company TEDA Center opened. Located in the Tianjin Economic-Technological Development Area, this facility is designed to meet LEED Gold standards and uses advanced technologies and green building practices to lower energy consumption at least 25 percent, as compared to conventional construction methods and materials. In Shanghai, Pratt & Whitney Global Service Partners broke ground on an engine overhaul facility targeted to meet LEED Platinum standards. Once complete, it is expected that at least 12.5 percent of the facility’s energy use will come from renewable sources.

UTC has a disciplined and proven approach to profitability and environmental responsibility. For more than 15 years, discipline and focus have guided UTC’s improvements in environmental performance and we look forward to building on our success in 2008.
